The tikzmark package

Andrew Stacey stacey@math.ntnu.no v1.0 from 2013/04/12

1 Introduction

The \tikzmark macro burst onto the scene in a blaze of glory on TeX-SX. Since then, it has proved embarrassingly (to its original author) popular. The idea behind it is extremely simple: that the machinery underneath TikZ provides a way to "mark" a point on a page for further use. This functionality is already provided by several other packages. The point of this one is that as TikZ can provide this feature, if already loading TikZ then it makes sense to use the TikZ version than another version. Moreover, if the goal is to use these marks with some TikZ code then this version is already set up for that purpose (not that it would be exactly difficult to add this to any of the other implementations).

2 Use

Using the \tikzmark is extremely simple. You need to load the tikz package and then load tikzmark as a tikzlibrary. Thus in your preamble you should have something like:

```
\usepackage{tikz}
\usetikzlibrary{tikzmark}
```

In your document, you can now type \tikzmark{<name>} at a point that you want to remember. This will save a mark with name <name> for use later (or earlier). To use it in a \tikz or tikzpicture, simply use the pic coordinate system:

```
\tikz[remember picture] \draw[overlay] (0,0) — (pic cs:<name>);
```

There are two important points to note:

1. The enveloping \tikz or tikzpicture must have the key remember picture set.

This is because of how TikZ coordinates work. The coordinates inside a TikZ picture are relative to its origin, so that origin can move around on

the page and not affect the internals of the picture. To use a point outside the picture, therefore, the current picture not only has to know where that point is on the page it also has to know where it itself is on the page. Hence the remember picture key must be set.

2. The drawing command must have the overlay key set (or be in a scope or picture where it is set).

This is to keep the bounding box of the current picture under control. Otherwise, it would grow to encompass the remembered point as well as the current picture. (This isn't necessary if the remembered point is inside the current picture.)

3 History

I wrote the original \tikzmark macro in 2009 for use in lecture slides prepared with the beamer package. It's original definition was:

```
\newcommand{\tikzmark}[1]{\tikz[overlay,remember picture]
    \node (#1) {};}
  Its first use was in the (inelegant) code:
\begin { frame }
\frametitle { Structure of Continuous Functions }
\begin{tikzpicture} [overlay, remember picture]
\useasboundingbox (0,0);
\frac{1}{draw} < 2 - |trans: 0| handout: 0 > [red, ->] (bsp) ... controls
    +(-1,-1) and (\$(cnvs.north)+(1,1)\$) ...
    (\$(cnvs.north)+(0,1)\$) .. controls
    (\$(cnvs.north)+(-1,1)\$) and +(-1,0) .. (cnvs.north);
\frac{3-|\text{trans}: 0|\text{handout}: 0}{|\text{green}!50!\text{black},->|} (\text{cplt}) \dots
    controls +(-1,-1) and +(-1,0) ... (mcplt.north);
\det <4-|trans: 0| handout: 0>[ blue,->] (norm) ... controls
    +(-1,-.5) and (\$(nvs.north)+(0,1.5)\$)
    (\$(nvs.north) + (0,1.5)\$) .. controls
    (\$(\text{nvs.north}) + (-1.5, 1.5)\$) \text{ and } + (-1.5, 0) \dots
    (nvs.north);
\frac{5-|\text{trans}: 0|\text{handout}: 0}{|\text{purple},->|} (vector) ...
    controls +(-1,-1) and (\$(vsp.north)+(2,2)\$) ...
    (\$(vsp.north)+(0,2)\$) .. controls
    (\$(vsp.north)+(-2,2)\$) and +(-2,0) .. (vsp.north);
\end{ tikzpicture }
\begin { theorem }
\centering
\( \big\backslash \mathbf{big}(C([0,1], \mathbb{R}), \mathbf{d}_\mathbf{hig}) \big\backslash ) \
```

```
is a \\
\alert {Banach\tikzmark {bsp} space}
\end{theorem}
\ pause
\bigskip
\begin{itemize}
\item[\tikzmark{cnvs}]
    { \color <.(2) -> \{green! 50! black \} Comp \tikzmark \{cplt\} lete \} }
    { \color <.(3) -> \{blue\} nor \tikzmark \{norm\} med \} }
    { \color < .(4) -> {purple } vector \land tikzmark \{ vector \} } space { \color < .(4) -> {purple } vector \land tikzmark \{ vector \} }
bigskip
\bigskip
\ pause
\setminus begin\{itemize\}[<+->]
\item[\tikzmark{mcplt}] \{\color{\green!50! black}Cauchy
    sequences converge.
medskip
\item[\tikzmark{nvs}] \{\color{blue}\}Metric from a norm.}
\medskip
\item[\tikzmark{vsp}] {\color{purple}}Functions behave like
    vectors.
\end{itemize}
\end{itemize}
\end{frame}
```

This produced, on the final slide, Figure 1.

Its first appearance on TeX-SX was in an answer to a question about how to put overlapping braces on a mathematical text. This was in July 2010. The opening statement of the answer was not overly encouraging: "This may not be the best solution...". And for a macro that would go on to become quite ubiquitous, its initial appearance only garnered it 2 votes.

However, it started out in life as a useful macro for me and as such I found more uses for it in my own code and thus more opportunity for using it to answer questions on TeX-SX. The one that seems to have been where it got noticed came in August 2010, again about putting braces in text but in a more complicated fashion. From this answer, it got picked up, picked over, and picked apart. A common use was in highlighting or adding marks to text.

Gradually, as it got used, it developed. A major revision dates from an answer given in March 2012 where the question was actually about \tikzmark. This version added two important features: a TikZ coordinate system for referencing saved marks directly and the ability to refer to marks earlier in the document

Structure of Continuous Functions

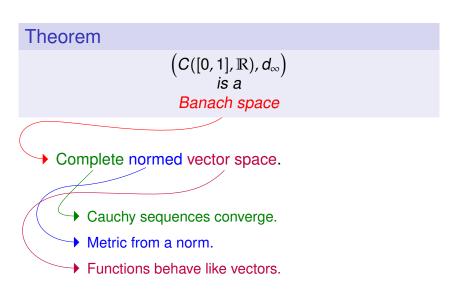

Figure 1: First use of tikzmark

than they are defined (the mechanism for remembering points uses the aux file anyway so this was more about exposing the information earlier than anything complicated). Then in October 2012 there was a question where it would have been useful to remember which page the mark was on and a question where for some reason using the \tikz macro didn't work so the \pgfmark macro was introduced.

4 Usage

This package defines the following commands and usable stuff.

1. $\tikzmark[\langle drawing\ command \rangle] \{\langle name \rangle\}$

The mandatory argument is the name of the mark to be used to refer back to this point later.

The \tikzmark command can take an optional parameter which is some drawing command that can be put in a \tikz ...; command. This drawing command can be used to place a node or something similar at the marked point, or to set some \tikzset keys. Sometimes this can be useful. Note, though, that if this is used to define an offset coordinate then this will only be available in the document after the \tikzmark command, even on later

2. $pgfmark{\langle name \rangle}$

This is a more basic form of the \tikzmark which doesn't use any of the \tikz overhead. One advantage of this command is that it doesn't create an hbox.

3. $\left(\frac{\langle name \rangle}{\langle true\ code \rangle}\right)$

This is a simple conditional to test if a particular mark is available. It executes true code if it is and false code if not.

4. (pic cs:<name>) or (pic cs:<name>,<coordinate>)

This is the method for referring to a position remembered by \tikzmark (or \pgfmark) as a coordinate in a tikzpicture environment (or \tikz command). If the extra coordinate is specified then this is used in case the mark name has not yet been defined (this can be useful for defining code that does something sensible on the first run).

5. /tikz/save picture id=<name>

This is the TikZ key that is used by **\tikzmark** to actually save the connection between the name and the picture coordinate. It can be used on an arbitrary picture to save its origin.

6. /tikz/if picture id=#1#2#3

This is a key equivalent of the \iftikzmark command.

7. /tikz/next page, /tikz/next page vector

It is possible to refer to a mark on a different page to the current page. When this is done, the mark is offset by a vector stored in the key /tikz/next page vector. The key /tikz/next page can be used to set this to certain standard vectors by specifying where the "next page" is considered as lying corresponding to the current page. Possible values are (by default) above, below, left, right, and ignore. (The last one sets the vector to the zero vector.)

8. \subnode[options] {name} {content}

This produces a pseudo-node named name around the content. The design purpose of this is to create a "subnode" inside a TikZ node. As far as TikZ is concerned, the contents of a node is just a box. It therefore does not know anything about it beyond its external size and so cannot easily determine the coordinates of pieces inside. The \subnode command boxes its contents and saves the position of that box and its dimensions. This information is stored in the same way that PGF stores the necessary information about a node. It is therefore possible to use ordinary node syntax (within a tikzpicture) to access this information. Thus after \node {a \subnode{a}{sub} node}; it is possible to use a as a node. The options are passed to the node construction mechanism, but note that the only sensible options are those that affect the size and shape of the node: drawing options are ignored (except in so far as they affect the size – as an example, line width affects the node size).

There are two important points to make about this. The first is that, as with all the tikzmark macros, the information is always one compilation old. The second is that the pseudo-node is purely about coordinates: the path information is not used and the contents are not moved. This is partly for reasons of implementation: the pseudo-node is constructed when TikZ is not in "picture mode". But also interleaving the background path of the pseudo-node and any containing node would be problematic and so is best left to the user.

The simplest way to turn a pseudo-node into a more normal node is to use the fit library. Using the above example, \node[fit=(a),draw,inner sep=0pt] {}; would draw a rectangle around the word sub of exactly the same size as would appear had a normal node been created.

5 Examples and Extras

The \tikzmark command has been used in numerous answers on TeX-SX. The plan is to gather some of these into extra libraries which can be loaded via \usetikzmarklibrary.

At present, this is the code listings library (which works with the listings package). One that is in development (as it has featured much on the TeX-SX

website) is highlighting, however this is not so straightforward to implement so is still under development.

5.1 Basic Examples

A simple example of the \tikzmark macro is the following.

```
\[ \tikzmark{a} e^{i} \pi/2 = i \] \] This\tikz [remember picture, overlay, baseline=0pt] \\ \draw[->] \( (0,1em) \) to [bend left ] \( ([shift={(-1ex,1ex)}] pic cs:a); is an important equation. \] e^{i\pi/2} = i This is an important equation.
```

```
\begin{itemize}
\item A first item,\tikzmark{b}
\item A second item,\tikzmark{c}
\item A third item.\tikzmark{d}
\end{itemize}
\begin{tikzpicture}[remember picture, overlay]
\draw[decorate, decoration={brace}] ({pic cs:c} |- {pic cs:b}) +(0,lem) -- node[right, inner sep=lem] {some items} ({pic cs:c} |- {pic cs:d});
\end{tikzpicture}
```

- A first item,
- A second item, some items
- A third item.

```
\begin{tikzpicture}[remember picture]
\node (a) at (0,0) {This has a \subnode{sub}{subnode} in
   it };
\draw[->] (0,-1) to[bend right] (sub);
\end{tikzpicture}
```

5.2 Code Listings

If the listings package has been loaded then issuing \usetikzmarklibrary{listings} will load in some code to add marks to lstlisting environments. This code places a mark at three places on a line of code in a listings environment. The marks are placed at the start of the line, the first non-whitespace character, and the end of the line (if the line is blank the latter two are not placed). (This has not been extensively tested, it works by adding code to various "hooks" that are made available by the listings package; it is quite possible that the hooks chosen are both wrong and insufficient to cover all desired cases.)

These are inspired by questions such as Marking lines in listings and Macros for code annotations.

In more detail, the listings library places lots of marks around the code. The marks are:

- line-<name>-<number>-start at the start of each line.
- line-<name>-<number>-end at the end of each line.
- line-<name>-<number>-first at the first non-space character of the line (assuming it exists).

The line numbers should match up with the line numbers in the code in that any initial offset is also applied.

Not every mark is available on every line. If a line is blank, in particular, it will only have a start mark. The following example shows this, where the red dots are the start, the blue are end, and the green are first.

```
\begin{tikzpicture}[remember picture]
   \foreach \k in \{0, \ldots, 7\} {
   \iftikzmark{line-code-\k-start}{\fill[red, overlay] (pic
       cs: line-code-\k-start)
       circle[radius=4pt];}{\message{No start for \k}}
   \iftikzmark{line-code-\k-end}{\fill[blue,overlay] (pic
       cs: line-code-\k-end)
       circle[radius=2pt];}{\message{No end for \k}}
   \iftikzmark{line-code-\k-first}{\fill[green, overlay]
       (pic cs: line-code-k-first)
       circle [radius=2pt]; } { \ message { No first for \k} }
   \langle draw[->, overlay] (0,0) -- (pic cs: line-code-5-first);
   \langle draw[->, overlay] (0,0) -- (pic cs: line-code-5-start);
   \langle draw[->, overlay] (0,0) -- (pic cs: line-code-5-end);
   \node[above] at (0,0) {Line 5};
   \end{tikzpicture}
   \begin{lstlisting} [language=c, name=code, numbers=left]
    #include <stdio.h>
     int main (void)
     {
          printf("hello, world\n");
          return 0;
   \ \ \backslash \mathbf{end} \{\, \mathtt{lstlisting} \,\}
   Line 5
  #include <stdio.h>
  int main (void).
2
3
4
5
       printf("hello, world\n");
6
       return 0;
```

This example puts a fancy node behind certain lines of the code, computing the necessary extents.

```
\balloon{comment}{more code}{3}{3}
  \balloon{comment}{more code}{7}{8}
  \begin{lstlisting} [language=c, name=more
      code, numbers=left, firstnumber=3]
    #include <stdio.h>
     int main (void)
         printf("hello, world\n");
         return 0;
   \end{lstlisting}
  #include <stdio.h>
5
  int main(void)
6
7
       printf("hello, world\n");
8
       return 0;
9
```

6 Acknowledgements

The \tikzmark macro has been used and abused by many users of TeX-SX. Of particular note (but in no particular order) are Peter Grill, Gonzalo Medina, Claudio Fiandrino, and percusse. I would also like to mention David Carlisle whose knowledge of TikZ continues to astound us all.

7 Implementation

7.1 Main Code

```
1 \tikzset{%
2  remember picture with id/.style={%
3  remember picture,
4  overlay,
5  save picture id=#1,
6 },
```

Not totally happy with using every picture here as it's too easily overwritten by the user. Maybe it would be better to patch endtikzpicture directly.

```
7 every picture/.append style={%
8 execute at end picture={%
9 \ifpgfrememberpicturepositiononpage%
10 \edef\pgf@temp{%
```

```
\noexpand\write\noexpand\pgfutil@auxout{%
               11
               12
                          \string\savepicturepage{\pgfpictureid}{\noexpand\thepage}}}%
               13
                       \pgf@temp
                       \fi%
               14
                     },
               15
               16
                   },
              The positions are already recorded in the aux file, all we really need to do is
              provide them with better names.
                   save picture id/.code={%
               18
                       \immediate\write\pgfutil@auxout{%
                          \string\savepointas{#1}{\pgfpictureid}}%
               19
                   },
               20
              Provides a way to test if a picture has already been saved (in particular, can avoid
              errors on first runs)
                   if picture id/.code args={#1#2#3}{%
               22
                     \@ifundefined{save@pt@#1}{%
               23
                        \pgfkeysalso{#3}%
                     }{
               24
               25
                        \pgfkeysalso{#2}%
               26
                     }
               27
                  },
              Page handling
                   next page/.is choice,
                   next page vector/.initial={\pgfqpoint{0pt}{0pt}},
                   next page/below/.style={%
                     next page vector={\pgfqpoint{0pt}{-\the\paperheight}}%
               31
               32
                   },
                   next page/above/.style={%
               33
                     next page vector={\pgfqpoint{0pt}{\the\paperheight}}%
               34
               35
                   next page/left/.style={%
               36
                     next page vector={\pgfqpoint{-\the\paperwidth}{0pt}}%
               37
               38
                   next page/right/.style={%
               39
                     next page vector={\pgfqpoint{\the\paperwidth}{0pt}}%
               40
               41
                   },
                   next page/ignore/.style={%
               42
                     next page vector={\pgfqpoint{0pt}{0pt}}%
               44
                   },
               45 }
\savepointas
              This is what gets written to the aux file.
               46 \def\savepointas#1#2{%
                   \expandafter\gdef\csname save@pt@#1\endcsname{#2}%
               47
               48 }
               49 \def\savepicturepage#1#2{%
                   \expandafter\gdef\csname save@pg@#1\endcsname{#2}%
               51 }
```

```
\tmk@labeldef Auxiliary command for the coordinate system.
                52 \def\tmk@labeldef#1,#2\@nil{%
                    \def\tmk@label{#1}%

 \iflst@linemark A conditional to help with placing the mark at the first non-whitespace character.
                          \newif\iflst@linemark
       EveryLine This hook places the mark at the start of the line.
                  189 \lst@AddToHook{EveryLine}{%
                       \begingroup
                        \advance\c@lstnumber by 1\relax
                  191
                        \pgfmark{line-\lst@name-\the\c@lstnumber-start}%
                  192
                  193
                        \endgroup
                  194 }
             EOL This hook places the mark at the end of the line and resets the conditional for
                  placing the first mark.
                   195 \lst@AddToHook{EOL}{\pgfmark{line-\lst@name-\the\c@lstnumber-end}%
                  196 \global\lst@linemarktrue
                  197 }
       OutputBox Experimenting shows that this is the right place to set the mark at the first non-
                  whitespace character. But we only want to do this once per line.
                  198 \lst@AddToHook{OutputBox}{%
                       \iflst@linemark
                        \pgfmark{line-\lst@name-\the\c@lstnumber-first}%
                        \global\lst@linemarkfalse
                  201
                  202 \fi
                  203 }
\tikzmk@lst@fnum
                  An auxiliary macro to figure out if the firstnumber key was set. If so, it has the
                  form <number>\relax. If not, it expands to a single token.
                  204 \def\tkzmk@lst@fnum#1\relax#2\@STOP{%
                       \def\@test{#2}%
                  205
                        \ifx\@test\@empty
                  206
                        \def\tkzmk@lst@start{0}%
                  207
                  208
                        \else
                  209
                        \@tempcnta=#1\relax
                        \advance\@tempcnta by -1\relax
                        \def\tkzmk@lst@start{\the\@tempcnta}%
                  211
                  212
                       \fi
                  213 }
            Init Adds a mark at the start of the listings environment.
                  214 \lst@AddToHook{Init}{%
                       \expandafter\tkzmk@lst@fnum\lst@firstnumber\relax\@STOP
                  216
                        \pgfmark{line-\lst@name-\tkzmk@lst@start-start}%
                  217 }
```
